THE NEXT ROUND IS HERE — AND THE REAL CHALLENGE BEGINS!

First of all, congratulations to all the teams!

You all did an excellent job, and honestly, judging your projects was challenging for us as well. The quality of work and effort we saw made the selection difficult.

So, instead of selecting just 10 teams, we have decided to select 20 teams for the next round!

Now, you have **2 days to take your project to the next level.** This is your opportunity to improve your product, strengthen your technical implementation, and prove what your team is capable of.

NEXT ROUND CHALLENGE

Your task is to turn your project into a more complete, functional, and technically strong product.

1. **Website Development:** Develop all the required website pages with proper implementation of AEO (Answer Engine Optimization), GEO (Generative Engine Optimization), and SEO (Search Engine Optimization).
2. **Product Improvement:** Improve your existing website wherever possible. Focus on functionality, user experience, and overall product quality.
3. **Real Data Implementation:** Make sure your website collects and processes actual data wherever required. **Avoid simulations, dummy data, and fake functionality.** We want to see real implementation, not just a demonstration.

EVALUATION CRITERIA — 50% SUBMISSION + 50% TECHNICAL INTERVIEW

This round will be evaluated equally on your project submission and your technical knowledge.

50% — Project Submission

You must submit the following:

- GitHub Repository URL
- Live Hosted Website URL
- Project Flowchart

Your submission will be evaluated based on implementation, functionality, improvements, and overall technical approach.

50% — Technical Interview on Google Meet

Each team will get approximately **10 minutes on Google Meet**.

During this session, we will ask technical questions about your project, including your architecture, implementation, technologies, data handling, and the decisions you made while developing it.

We want to understand how well you know your own project and how confidently you can explain your approach.

⚡ ONE IMPORTANT THING

Using AI is absolutely fine. We encourage you to use the tools available to build better products.

But remember:

AI can help you write code. AI can help you build faster.

However, your technical knowledge, understanding, problem-solving ability, and implementation approach will determine the winning team.

You should be able to explain:

- What you have built and how it works.
- Why you chose your technologies and architecture.
- How your data is collected, processed, and stored.
- What challenges you faced and how you solved them.
- What makes your implementation different from others.

The winning team will not be decided only by how much code you write, but by how well you understand, build, and defend your product.

🔥 **You have 2 days. Make every hour count.**

Improve your product. Strengthen your implementation. Prepare for the technical questions.

All the very best to all 20 teams!

Let's see who can turn their idea into a truly functional product.
